KC-CP	KCKCCP	Killercan: SpectraFX - Copper Patina	400ml Aerosol
KC-BE	KCKCBE	Killercan: SpectraFX - Blue Emerald	400ml Aerosol

**PRODUCT DESCRIPTION**

The Most Dramatic Colour Changing Paint Available! While colour-changing paints have been available for many years, SpectraFX takes "colour shifting" to a whole new level.

SpectraFX can be applied to products in many ways, including:

- Spayed on
- Rolled On
- Silk Screening
- Injection Molded
- Air Brushed
- Extruded
- Applied like Printing Ink
- Brushed On With Typical Paint Brushes
- Powder Coated

**APPLICATION**

1. Prepare and basecoat your piece as you would any other paint job.
2. Mix SpectraFX at a ratio of 1 gram per ounce of liquid using an innercoat clear, colour blender, or even your final clear. 1 gram per ounce will yield a high concentration of SpectraFX using more than this can actually decrease the overall look. However using less even one-quarter ( $\frac{1}{4}$ ) to one-half ( $\frac{1}{2}$ ) gram per ounce will still produce dramatic colour change effects. (Try mixing various ratios and spraying them on sample panels until the desired effects are achieved.)

**\*\*NOTE: STEP 2** only refers to conventional range. Killer cans do not apply.

3. Apply SpectraFX with 1 wet or 2 medium coats.

**\*\*NOTE:** Again take caution here as too many coats will deaden the overall affect.

4. Allow to dry before clearing with a polyurethane clear or your choice of topcoats.

**\*\*NOTE:** We recommend spraying SpectraFX onto an opaque background like black. The colour fo the background will vary the end result. For example, the Copper/Patina colour will change to pearl over a grey background.
